THE PROBLEM

Every agent demo works. Production doesn't. Agents die on rate limits, timeouts, expired tokens, broken JSON. Monk attacks itself with those failures, recovers, and keeps what works.

WHAT IT REACHES real systems, real credentials, real consequences

A live GitHub repo over MCP. A Daytona sandbox where it clones, reproduces, fixes and tests code before opening a PR. The web. You, via TUI or Telegram. Phone: built, parked.

WHERE IT STOPS at the line, every time

Merge, delete, release, uninstall, pay: nothing irreversible happens without you. TrueForge pauses it, showing the exact action and target. **The gate lives in TrueForge, not the prompt: no chaos, no clever wording gets past it.**

ARCHITECTURE one seam, zero forks

Every tool call runs through the chaos proxy: faults in, recoveries out.

| HOW TRUEFORGE WAS USED stock, untouched, fully exploited

SDK: sessions, streamed turns, event logs. **Settings API:** models, the chaos proxy, git-hosted skills, Daytona. **Agent spec:** approvals, questions, sandbox, subagents. **Monk is plugins, not a fork: any TrueForge agent can use them.**

| WHAT IS REAL VS MOCKED

REAL

Everything the agent touches: GitHub, Daytona, the LLM, TrueForge's gate. Every pass is scored on real repo state or hidden tests. **No LLM grades anything.**

SIMULATED

Only the faults, on purpose: that's the product. Offline demo modes are clearly labelled.

| KNOWN LIMITS and what's next

One seed so far; more seeds and generations are next, to turn the recovery gain into task wins. Chaos targets MCP tools today; sandbox commands come next.
